

ROWATINEX® Indications

Urolithiasis: ROWATINEX® is used in the treatment of patients with stones in their kidneys or elsewhere in their urinary tract.

Recommended Dosage:

Capsules: For most patients the best dose is two capsules taken three times daily 30 minutes before meals.

Liquid: The usual dose is 3-5 drops of liquid 4-5 times daily 30 minutes before meals. In cases of colic, 20-30 drops may be given and repeated, if necessary, 20 minutes later.

Mode of Action:

ROWATINEX® : Increasing the solubility of the constituents of renal stones in urine thus helping to dissolve the stones and facilitate their elimination.

ROWATINEX® : Reducing the spasms of the smooth muscles of the urinary tract. These spasms can cause considerable pain and discomfort to patients with stones even when the stones are very small.
The presence of stones in the urinary tract significantly increases the chances of a patient developing a urinary tract infection.

ROWATINEX® has an antibacterial effect, which helps to reduce the risk of these infections.
